

En Pointe & HP Laying the Groundwork for Success

The Power of 2 to help you upgrade to Microsoft Exchange 2007.

When your enterprise runs on Microsoft exchange server 2007, you enable a people-ready business environment that achieves new levels of productivity

TOP 10 REASONS TO UPGRADE

Server Roles - Exchange Server 2007 provides a new modular system that can configure one or more of five basic server roles. Choosing a role means enabling only those features necessary to that role, thereby decreasing the surface area for attacks through other features.

WebReady Document Viewing - A new option in Outlook Web Access allows Office documents to be accessed as email attachments or through public folders to be displayed as HTML, even if Office isn't installed on the client PC.

Exchange Management Shell - The PowerShell scripting language, specifically optimized for Exchange, offers potent new tools for the email administrator.

Exchange ActiveSync - Improved direct push email ensures that ActiveSync clients receive messages on server connect. Other mobile-friendly features include inline message fetch - the ability to download long attachments without reloading the entire message - and information rights management, which allows users with the proper authority to view protected messages without being connected to a server.

Exchange Forefront and Exchange Hosted Services - Forefront is a rebranding of the Antigen anti-virus/anti-spam products acquired from Sybari, which together provide a quality local security gateway. The Exchange Hosted Services version, available by subscription, delivers additional security, archiving and continuity.

Outlook Web Access - The latest OWA client is a near-perfect clone of the Outlook desktop interface. Features and views are nearly the same, and the performance is seamless.

Outlook auto-discover - Exchange 2007 combined with Outlook 2007 means administrators will no longer need to walk to client desktops to configure Outlook access to a specific location. Users simply enter their names and passwords and Outlook automatically finds local Exchange servers, locates the proper email account and sets up the access.

Smart scheduling - The addition of Scheduling Assistant and Calendar Attendant mean that Exchange tracks not only the schedules of all meeting invitees but also the availability of meeting rooms. All of this can be managed on the server so meetings can be fully scheduled even if everyone's Outlook client is not connected.

Improved search - The new search algorithm boosts the speed at which Outlook can find certain messages in large message stores. Administrators can access the same fast indexing in multiple-mailbox searches.

Bundled encryption - Exchange 2007 can automatically encrypt all email messages sent within the local organization. It also automatically supports Transport Security Layer encryption, including built-in certificates, as long as both hosts support TLS.

Exchange Solution Elite Program - En Pointe has been named a « Go to » provider of Exchange 2007 on HP

- Review & Recommend
- DNS/WINS/DCHP Configuration
- Group Policy – Forest/Domain
- Naming Standards
- Replication
- Active Directory
- Domain Controller Design

Why En Pointe Technologies?

En Pointe's Professional Services Organization provides in-depth knowledge & real-world experience to assist clients in assessing, evaluating, testing, designing & implementing Microsoft & HP-based solutions that not only meet current business requirements, but also support future initiatives.

Our services drive out cost, improve productivity with proper architecture design & implementation services....centered on Microsoft Infrastructure Optimization

Our Professional Service

Organization has the experience you need as you implement Microsoft solutions, especially on HP. Our engineers have worked extensively with Exchange throughout the USA, along with other Microsoft solutions including migration of GroupWise to Exchange, Active Directory, SMS Asset Management, data base and directory migrations & consolidations.

And, of course, we have extensive experience on HP Server and Storage platforms.
